

# AI-Powered Placement Enhancement Platform - Process Flow

|        |                                                                                        |
|--------|----------------------------------------------------------------------------------------|
| Start  | Resumes + Job Descriptions + Batch Context                                             |
| Step 1 | Resume Preprocessing → Extract text, clean, create structured JSON summary             |
| Step 2 | Resume Indexing → Store summaries (JSON or Vector DB for scalability)                  |
| Step 3 | Job Matching Pipeline → LLM compares JD with resume summary                            |
|        | Output: Match Score, Strengths, Missing Keywords, Verdict                              |
| Step 4 | Batch-Level Analysis → Top candidates, average batch score, common missing skills      |
| Step 5 | Feedback → Students (resume improvement), TNP Cell (strategy), Recruiters (shortlists) |
| Step 6 | Frontend-Backend Flow → Analyze Batch → API → JSON → Dashboard Display                 |
| End    | Improved Placement % (15–30%), Recruiter Efficiency, Student Readiness                 |
